

Notes

We will be talking about new functions in Js like `setTimeout`, `setInterval` which allows us to execute code after a particular duration of time.

Also, the new data structure that Js uses called 'message queue' along with Execution Stack.

```
setTimeout( function(){
    ...
}, 1000)
// the second argument is the time in ms after which,
// the function in the first argument gets executed

setInterval( function(){
    ...
}, 1000)
// the second argument is the time period in ms which,
// the function in the first argument gets executed repeatedly

timeoutVar =setInterval( function(){
    ...
}, 1000)

intVar =setInterval( function(){
    ...
}, 1000)

clearTimeout(timeoutVar)
// Clear the timeout. or stops the setTimeout from executing
clearInterval(intVar)
// Clear the interval. or stops the setInterval from executing
```
